In this project, storage function for both the raw blocks data and UTXO were introduced, preventing data loss when closing Naivecoin program. In addition, regular testing of the functionality of the program was also done to check if any bugs were found, which also boosted the understanding of the operation and logic behind the Naivecoin system. Moreover, section 2, 3 of the report, presentation slides and video recording were implemented.

On the other hand, in order to maintain smooth regular progress on the project, regular weekly meetings were held to discuss the latest objective and offer help to group mates with difficulties on installing or understanding the how to use the Naivecoin.
